"Primary structure and properties of the cathepsin G/chymotrypsin inhibitor from the larval hemolymph of Apis mellifera.";
Eur. J. Biochem. 262:680-687(1999)
-!- FUNCTION: Chymotrypsin and cathepsin G inhibitor.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Contains 1 TIL (Trypsin inhibitory-like) domain.

THE MUCIN-LIKE DOMAIN MIGHT INHIBIT INAPPROPRIATE TRAPPING OF
SPERMATOZOA OR PROMOTING ADHESION TO THE OVIDUCTAL ISTHAUS.
-!- DOMAIN: The WWFD domain 2 may mediate covalent oligomerization (by
similarity to human intestinal mucin MUC2).
-!- SIMILARITY: Contains 3 MAM domains.
-!- SIMILARITY: Contains 1 EGF-like domain.
-!- SIMILARITY: Contains 1 EGF-like domain.
-!- CAUTION: Ref. 2 sequence differs from that shown due to
transposition of a number of exons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -I. FUNCTION: BINDS IN A SPECIES-SPECIFIC MANNER TO THE ZONA PELLUCIDA OF THE EGG. MAY BE INVOLVED IN GAMETE RECOGNITION AND/OR

IACTOFERRIN, CLUSTERIN AND CALCIUM.
COMPLEX, APOLIPOPROTERIN B-ENRICHED BETA-VLDL, LIPOPROTEIN LIPASE,
IACTOFERRIN, CLUSTERIN AND CALCIUM.
APROTININ, ANINOGLYCOSIDES AND POLYMAKIN B.
C. I- FUNCTION: RECEPTOR-MEDIATED UPTAKE OF POLYBASIC DRUGS SUCH AS
APROTININ, ANINOGLYCOSIDES AND POLYMATIN B.
C. I- SUBGINIT: Forms a multimeric complex together with a receptor-
associated protein (RAP). Binds to ankyrin-repeat family A protein
C. I- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN. EXPRESSED IN
CLEAVARGA AT THE CELL SURFACE.

SUBMITTED WAY ACT AS A RECEPTOR FOR THE ENDOCTYOSIS OF
EXTRACELLULAR LIGANDS SUCH AS CHYLOMCRON REMNANTS, PROTEASE-
INHIBITOR COMPLEXES AND VITELLOGENIN.
--- SUBCELLULAR LOCATION: Type I membrane protein.
--- SIMILARITY: Contains 35 LDL-receptor class A domains.
--- SIMILARITY: Contains 17 EGF-like domains.

The receptor for yolk lipoprotein deposition in the chicken oocyte.";

J. Biol. Chem. 266:18761-18770(1991).

-! FUNCTION: Binds VLDL and transports it into cells by endocytosis.

-! FUNCTION: Binds VLDL and transports it into cells by endocytosis.

In order to be internalized, the receptor-ligand complexes must first cluster into clathrin-coated pits. Binding to Reelin induces tyrosine phosphorylation of Dabl and modulation of Tau
                                                                                                                                                            Gallus gallus (Chicken).

In order to be internalized, the receptor-ligand complexes must first cluster into clathrin-coated pits. Binding to Reelin induces tyrosine phosphorylation of Dabi and modulation of Tau phosphorylation (By similarity). SUBUNIT: Binds to the extracellular matrix protein Reelin (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                R GO; GO: 0005041; F:low-density lipoprotein receptor activity; TAS.

TISSUE SPECIFICITY: ABUNDANT IN HEART AND SKELETAL MUSCLE; ALSO OVARY AND KIDNEY; NOT IN LIVER.
SIMILARITY: Contains 8 LDL-receptor class A domains.
SIMILARITY: Contains 6 LDL-receptor class B domains.
SIMILARITY: Contains 3 EGF-like domains.
                                                                            similarity).
SUBCELLULAR LOCATION: Type I membrane protein.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A Geneseq 19Jun03:*

                                                                                                                       protein (NAP). The protein has activity as an anticoagulant and/or serine protein (NAP). The protein has activity as an anticoagulant and/or serine protease inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/Fr. The specification for factor VIIa/Fr. The specification for factor VIIa/Fr selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the activated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (aPTT) assay; calculating proportion of clotting effected by the isolated protein in each of the rand aptr assay, with respect to a baseline clotting value for cach assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a calculating a protein give method is calculating at the aptr prolongation ratio, where a ratio at least one is indicative of factor VIIa/FF inhibitory activity. The method is useful for determining if a protein has factor VIIa/FF inhibitory

                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is the Ancyclostoma caninum nematode-extracted anticoagulant protein AcaNAPc2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated incravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes (the coding sequence can also be used for this) or as diagnostic tests. The protein can also be used as a vaccine against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9

                       Lauwereys MJ, Laroche YR;
                                                                                                                                                                                                                                                                                                                                                                                             They can also be used as immunogens in prophylactic and therapeutic vorm. Vaccines against parasitic worm infection. The proteins may double the clotting time of human plasma in prothrombin time assays when present at 10-50 nMol, and double the clotting time of human plasma in prothrombin time assays plasma in activated partial thrombin time assays at 10-100 nMol.
                                                                                                                                                                                                                                                           activity, isolated from nematodes, are useful to inhibit blood coagulation. The proteins can be added to blood collection tubes defining the collection of mammalian plasma. They are also useful to prevent or inhibit thrombosis, and may be given alone or in combination with other therapeutic or in vivo diagnostic agents. The proteins can serve as immunogens to raise antibodies for use in the diagnosis and identification of NAP concn. levels in biological fluids, e.g. to detect mammalian infection with a parasitic worm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The anticoagulant proteins are pref. derived from Ancylostoma caninum, A. ceylanicum, A. duodenale, Necator americanus or Heligomosmoides polygyrus.

The proteins pref. have 2 NAP domains and specifically inhibit the catalytic activity of the factor VIIa/TF complex in the presence of factor Xa or a catalytically inactive factor Xa deriv., do not specifically inhibit the activation of factor VIIa in the absence of TF and do not specifically inhibit prothrombinase. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                            Proteins with anticoagulant and/or serine protease inhibitory activity - isolated from nematodes and useful to inhibit blood
                                                                                                                                                                                                                                           Proteins with anticoagulant and/or serine protease inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nematode extracted anticoagulant protein; NAP; anticoagulant; serine protease inhibitor; NAP domain; factor VIIa/TF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Length 91;

protein (NAP). The protein has activity as an anticoagulant and/or serine protease inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TF. The specification of containing the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin [PT] assay and an ex vivo activated partial thromboplastin time (APTT) assay, calculating a prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, where prolongation of clotting is calculated as fold clevation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting value, where calculating a PT to aPTT prolongation ratio, where a ratio, and calculating a PT to aPTT prolongation ratio, where a ratio, at least one is indicative of factor VIIa/FF inhibitory activity. The method is useful for determining if a protein has factor VIIa/FF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 KATMQCGENEKYDSCGSKECDKKCKYDGVEEEDDEEPNVPCLVRVCHQDCVCEEGFYRNK

The protein has activity as an anticoagulant and/or serine protein in the protein contains at least one NAP domain which has selective inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIA/TF specification describes a method for screening an isolated protein at least one domain for factor VIIA/TF selective inhibitory activity. The method comprises determining the time to clotting an isolated protein at least one domain captured partial thromboplastin time (APT) assay and an ex vivo activated partial thromboplastin time (APT) assay and an ex vivo prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay with respect to a baseline clotting value for each assay, where prolongation of clotting time relative to a baseline clotting value, where a doubling of clotting time is deemed a two-fold elevation; and a doubling of clotting time is deemed a two-fold elevation; and a calculating as PT to aPTT prolongation ratio, where a ratio at least one is indicative of factor VIIA/TF inhibitory activity. The method is useful.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present sequence is the Ancyclostoma caninum nematode-extracted anticoagulant protein AcaNAPc2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminanted intravascular coaqulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes (the coding sequence can also be used for this) or as diagnostic tests. The protein can also be used as a vaccine against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
```

```
The present sequence represents a nematode extracted anticoagulant protein has activity as an anticoagulant and/or serine proteins (NAP). The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TF selective inhibitory activity. The method comprises certaining the time to clotting effected by a concentration of the confidence of isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (PT) assay and an ex vivo activated partial thromboplastin time (PT) assay, and ex vivo cativated partial thromboplastin time (PT) assay, and ex vivo prothrombin time (PT) assay and an ex vivo cativated partial thromboplastin time (PT) assay, and ex vivo cativated protein in each of the PT and assay, where prolongation of clotting is calculating value for each assay, where prolongation of clotting is calculated as fold clavation of clotting time relative to a baseline clotting value, where catoulating a PT to aPTT prolongation ratio, where a ratio at least calculating a PT to aPTT prolongation ratio, where a ratio at least cone is indicative of factor VIIa/FF inhibitory activity. The method is useful for determining if a protein has factor VIIa/FF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4 CGSNERYSDCGNDKQCERKCNEDDYEKGDE----ACRSHVCERPGACVCEDGFYRNKKG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             protein (NAP). The protein has activity as an anticoagulant and/or serine protein (NAP). The protein has activity as an anticoagulant and/or serine protease inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/Fr. The specification for factor VIIa/Fr selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo protrombin time (FT) assay and an ex vivo activated partial thromboplastin time (aPTT) assay; calculating prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting value, calculating a PT to aPTT prolongation ratio, where a ratio at least one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  4 CGSNERYSDCGNDKQCERKCNEDDYEKGDE----ACRSHVCERPGACVCEDGFYRNKKG 58

                                                                                                                                                                                                                                                                                                                                                                             The present sequence is the Ancyclostoma ceylanicum nematode-extracted anticoagulant protein AceNAP4d2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infaction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, instance, the antibodies can be raised in order to detect infection by nematodes or as diagnostic tests. The protein can also be used as a vaccine against nematode parasites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              62

The present sequence is the Ancyclostoma ceylanicum nematode-extracted anticoagulant protein AceNAP4d2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atheroselerotic plaque, acute myocardial infarction, angina, thrombolyic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes or as diagnostic tests. The protein can also be used as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   6 CGENEKYDSCGS-KECDKKCKYDGVEEEDDEEPNVPCLVRVCHQD--CVCEEGFYRNKDD

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Proteins with anticoagulant and/or serine protease inhibitory activity, isolated from nematodes, are useful to inhibit blood coagulation. The proteins can be added to blood collection tubes defining the collection of mammalian plasma. They are also useful to prevent or inhibit thrombosis, and may be given alone or in combination with other therapeutic or in vivo diagnostic agents. The proteins can serve as immunogens to raise antibodies for use in the diagnosis and identification of NAP concn. levels in biological fluids, eg. to detect mammalian infection with a parasitic worm. They can also be used as immunogens in prophylactic and therapeutic vaccines against parasitic worm infection. The proteins may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The anticogulant proteins are pref. derived from Ancylostoma caninum, A. ceylanicum, A. duodenale, Necator americanus or Heligomosmoides polygytus.

The proteins pref. have 2 NAP domains and specifically inhibit the catalytic activity of the factor VIIa/TF complex in the presence of factor Xa or a catalytically inactive factor Xa deriv., do not specifically inhibit the activation of factor VIIa in the absence of TF and do not specifically inhibit prothrombinase. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 double the clotting time of human plasma in prothrombin time assay when present at 10-50 nMol, and double the clotting time of human plasma in activated partial thrombin time assays when present at 10-100 nMol.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Proteins with anticoagulant and/or serine protease inhibitory activity - isolated from nematodes and useful to inhibit blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            43.6%; Score 212; DB 17; Length 190; 50.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                protein (NAP). The protein has activity as an anticoagulant and/or serine protease inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (aPT) assay; calculating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    6 CGENEKYDSCGS-KECDKKCKYDGVEEEDDEEPNVPCLVRVCHQD--CVCEEGFYRNKDD 62
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold a doubling of clotting time relative to a baseline clotting value, where a doubling of clotting time is deemed a two-fold elevation, and calculating a PT to aPTT prolongation ratio, where a ratio a telast one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         8; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a nematode extracted anticoagulant protein (MAP). The protein has activity as an anticoagulant and/or serine protein in this protein contains at least one NAP domain which has selective inhibitory activity for factor VIIA/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIA/TF selective inhibitory activity. The method comprises determining the time to clotting an isolated by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo cativated partial thromboplastin time (aPT) assay and an ex vivo prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting value, where a calculating a PT to aPTT prolongation ratio, where a ratio at least cone is indicative of factor VIIA/TF inhibitory activity. The method is useful for determining if a protein has factor VIIA/TF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Screening an isolated protein for Nematode-extracted Anticoagulant
Protein domains

protein (NAP). The protein has activity as an anticoagulant and/or serine protein (NAP). The protein has activity as an anticoagulant and/or serine protease inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain for for factor VIIa/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (aPTT) assay; calculating prolongation of clotting effected by the isolated protein in each of the PT and apTT assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value for a can assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a adoubting of clotting time relative to a baseline clotting value, calculating a PT to aPTT prolongation ratio, where a ratio at least one is indicative of factor VIII-YFF inhibitory activity. The method is useful for determining if a protein has factor VIIIa/TF inhibitory
Screening an isolated protein for Nematode-extracted Anticoagulant Protein domains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequence represents a nematode extracted anticoagulant
